

Problem Statement

Why AGENTOS exists and what it sets out to do

The problem

A student who wants to become, say, a backend developer faces a maze: which skills matter, in what order, how deep to go, and how to know when they are ready. Existing platforms offer fixed video courses with no notion of the learner's goal, timeline or current level. Resumes are written blind, interviews are practiced alone, and revision is left to memory. The result is months of unfocused effort with no measurable outcome.

Why existing solutions fall short

Course portals teach but do not plan, measure or adapt. Resume checkers score documents but never connect the gaps to a learning plan. Interview question banks never grade answers or track progress across rounds. None of them combine planning, teaching, testing, revision and reporting in one feedback loop owned by the learner.

Objectives

1. Generate a personal, week-by-week preparation plan from a target role, timeline and current skills. 2. Teach each topic and score every answer with actionable feedback. 3. Convert weak answers into remedial tasks and scheduled revision automatically. 4. Quantify job-readiness as a single score backed by skills, projects, interviews and activity. 5. Keep the learner engaged with streaks, badges and weekly coaching.

Scope

In scope: goal planning and re-planning, tasks with due dates and notes, AI tutoring, answer scoring, spaced-repetition reviews, quizzes, mock interviews, resume analysis, progress dashboards and PDF reports, all behind secure multi-user accounts. Out of scope: real job listings, video content hosting, and social or classroom features.

Users and success criteria

Primary users are students and early-career switchers preparing for software roles. The project succeeds if a new user can register, receive a plan, submit answers, and watch their readiness score move within one sitting - and if every release passes the full automated test suite and deploys without manual server work.
